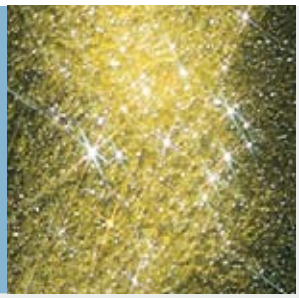
I nostri punti di forza
Our strengths

IL DIAMANTE | *THE DIAMOND*

In SAID tutto parte dal diamante, purissimo elemento "superabrasivo" capace di offrire prestazioni eccezionali sui più diversi materiali. Qualità controllate e selezionate all'interno dell'azienda garantiscono massima affidabilità.
In SAID everything starts with the diamond, extremely pure "superabrasive" element able to offer exceptional performance on the most varied materials. The quality is controlled and selected within the company so as to guarantee the maximun reliability.



SELEZIONE E COMPOSIZIONE | *SELECTION AND COMPOSITION*

Il segreto SAID è a larga parte depositato nella scelta e nel dosaggio delle polveri metalliche e delle resine impiegate nella realizzazione della vasta gamma di leganti.
SAID secret is mainly found in the choice and in the dosage of the metallic powders and of the resins used in the production of a wide range of binding agents.

PRODOTTO E APPLICAZIONI | *PRODUCT AND APPLICATIONS*

La proposta SAID risponde alle diverse esigenze di taglio, affilatura, levigatura e lucidatura, offrendo soluzioni a tutto tondo sia per la grande industria come per il laboratorio artigiano.
SAID proposal responds to the various necessities of cutting, sharpening, smoothing and polishing, offering overall solutions both for the large industries and for the small craftsman.

RICERCA E SERVIZIO | *RESEARCH AND SERVICE*

La ricerca SAID, alla base dello sviluppo aziendale, viene applicata alle varie richieste provenienti dal mercato. I ritrovati dopo attente verifiche, vengono immediatamente proposti con il supporto di adeguati servizi di consulenza.
SAID research, which is the basis of the company development, is applied to all the various requests which come from the market. The discoveries, after careful controls, are immediately proposed with all the adequate support of consultancy services.

ORGANIZZAZIONE | *ORGANIZATION*

Il marchio SAID identifica la qualità di una struttura produttiva perfettamente collaudata. Dinamica, flessibile, completa in tutte le sue parti, agisce con tempestività in tutto il mondo.
SAID mark identifies the quality of a production structure which is perfectly tested. Dynamic, flexible, complete in all its parts it acts with speed in any part of the world.

I SUPERABRASIVI

Rispetto alle mole tradizionali, le mole in superabrasivo consentono di ottenere dei processi di rettifica con tempi più ridotti e con costi complessivi inferiori. L'utilizzo delle migliori materie prime, la ricerca di nuovi materiali e l'applicazione di tecnologie all'avanguardia consentono a SAID di portare sul mercato un prodotto progettato, realizzato e confezionato in ITALIA.

SUPER-ABRASIVE WHEELS

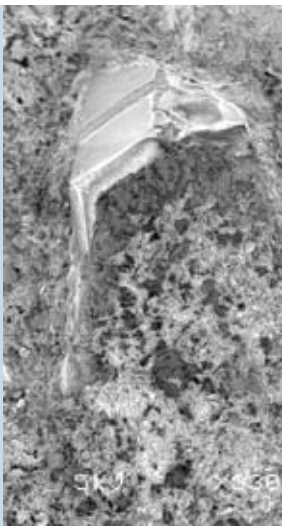
The super-abrasive wheels, if compared to the traditional ones, permit shorter and less expensive grinding operations. The use of the best rough materials, the search for new materials and the application of cutting-edge technologies permit to SAID to propose to the market a product designed, manufactured and packed in ITALY.

IL DIAMANTE

Il diamante è il più duro materiale conosciuto. Questa caratteristica ci consente di lavorare con facilità materiali quali la ceramica, i cermet, quarzo, vetro e materiali refrattari. Il diamante utilizzato presso la SAID è di tipo artificiale, ottenuto da un processo di sintesi a pressione e temperature elevatissime. Per garantire una migliore adesione alla matrice talvolta viene utilizzato il tipo ricoperto da un sottile strato di metallo, solitamente Nickel o Rame. L'unico limite del diamante è la sua reattività con i materiali ferrosi, per cui in tal caso si deve ricorrere al CBN.

DIAMOND

Diamond is the hardest material that we know. This permits to work easily materials like ceramic, cermet, quartz, glass and refractory materials. The diamond used at Said is an industrial diamond, obtained from a process of synthesis under very high pressure and temperatures. In order to grant a better adherence to the matrix, sometimes it is used the kind of diamond coated with a thin metal layer, usually nickel or copper. The only limit of the diamond is its reactivity with ferrous materials, so in those cases it is necessary the use of CBN.

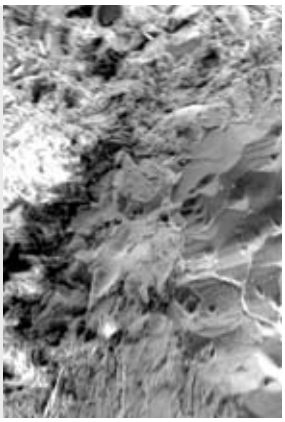


IL CBN

Il CBN, anche se meno duro del diamante, è caratterizzato da una resistenza chimica superiore. Viene prodotto per sintesi, ed è principalmente utilizzato per la lavorazione di acciai trattati termicamente, ghisa, acciai per molle, HSS e Stellite. Come nel caso del diamante, anche i cristalli di CBN vengono spesso ricoperti di un sottile strato metallico per aumentarne la capacità di ancoraggio e di smaltimento del calore.

CBN

CBN, even if it is less hard of the diamond, is marked out by a superior chemical durability. It is produced by synthesis, and it is used mainly to grind heat-treated steel, cast iron, steel for springs, HSS and stellite. As for diamond, also CBN crystals are coated by a thin metallic layer in order to increase their capacity of anchorage and heat removing.



LA GRANA

La scelta della granulometria influisce pesantemente sulla finitura e sulla quantità di materiale asportabile. Lo standard europeo FEPA definisce la grana in base al diametro medio dei cristalli misurati. La grana viene espressa in µm (micron).

GRIT SIZE

The choice of the granulometry affects on the finishing and the quantity of the material that can be removed quite heavily. FEPA European standards define the grit according to the medium diameter of the crystals that have been measured. The grit is expressed in µm (micron).

FORMA *MOLD*	GRANE FEPA *FEPA GRIT*
SGROSSATURA **ROUGHING**	252 213 181 151 126
SEMIFINITURA ***SEMI - FINISHING***	100 97 76
FINITURA **FINISHING**	64 54 46
LAPPATURA ***LAPPING***	30 20 15 9

Le geometrie
Geometries

Seguendo lo standard FEPA, SAID propone le geometrie più diffuse e ottimizzate per migliorarne l'ergonomia.
Following the standard FEPA, SAID offers the most widely used and optimized geometries to improve ergonomics.
